* Algebraic Properties of \mathbb{R} :-Add[~] Mult[~]On set of \mathbb{R} there are two binary operators $\underline{+}$ & $\underline{\cdot}$

These two operations follows few properties :-

A1) Commutative property of addition

$$a+b = b+a \quad \forall a, b \in \mathbb{R}$$

A2) Associative property of add[~]

$$(a+b)+c = a+(b+c) \quad \forall a, b, c \in \mathbb{R}$$

A3) Existence of zero element (Additive Identity) ✓

$$a+0 = 0+a = a \quad \forall a \in \mathbb{R}$$

A4) Existence of negative element (Additive Inverse)

$$a+(-a) = (-a)+a = 0 \quad \forall a \in \mathbb{R}$$

✓ M1) Commutative property of multiplication

$$a \cdot b = b \cdot a \quad \forall a, b \in \mathbb{R}$$

M2) Associative p of multi.

$$(a \cdot b) \cdot c = a \cdot (b \cdot c) \quad \forall a, b, c \in \mathbb{R}$$

M3) Existence of unit element (Multiplicative identity)

$$a \cdot 1 = 1 \cdot a = a \quad \forall a \in \mathbb{R}$$

M4) Existence of multiplicative inverse / Reciprocals ✓

$$a \cdot \left(\frac{1}{a}\right) = \frac{1}{a} \cdot a = 1 \quad \forall a \in \mathbb{R} - \{0\}$$

D) Distributive property of multiplication over add[~]

$$a \cdot (b+c) = a \cdot b + a \cdot c$$

$$(b+c) \cdot a = b \cdot a + c \cdot a$$

$$= a \cdot b + a \cdot c$$

$$\forall a, b, c \in \mathbb{R}$$

By method of contradiction.

Assume $a > 0 \Rightarrow (as 0 \leq a < \varepsilon) \Rightarrow a$ is positive
 $\Rightarrow \frac{a}{2}$ is positive

we can assume $\varepsilon = a/2 < a$

for any $\varepsilon > 0$, $0 \leq a < \varepsilon$ but for $\varepsilon_0 \Rightarrow 0 < \varepsilon_0 < a$

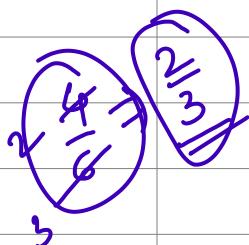

which contradicts to our assumption. \square
